01 COVER STORY Corporate security

Nvidia opens independent inquiry into Huang

Directors will examine reports of a foreign intelligence effort while backing the chief executive's continued leadership.

src: cnbc.com · 2 min read

Nvidia has opened an independent investigation following reports that co-founder and chief executive Jensen Huang was targeted by a foreign intelligence effort. CNBC reported that the inquiry concerns his relationship with a businesswoman whom intelligence agencies said was a Chinese spy. That allegation remains the subject of the investigation.

A committee of independent directors, assisted by outside independent counsel, will oversee the inquiry. The board said it had no reason to believe that national security or Nvidia secrets had been compromised, but would examine all available information. Its statement expressed confidence in Huang and his leadership team.

In an email to staff obtained by CNBC, Huang admitted being unfaithful to his wife, apologised to his family and colleagues, and said he would cooperate fully with the investigation. His admission does not establish the separate national security allegations.

Nvidia said Huang would continue leading the company without interruption. The board promised further updates as appropriate. For shareholders and partners, the unresolved question is what the independent inquiry establishes about access to sensitive information and any potential compromise.

02 TECH RADAR

France alleges Iranian fridge attacks

France accused Iran's Revolutionary Guard of attacks that warmed supermarket fridges. Iran has yet to respond; France has not disclosed its attribution evidence.

03 AI Cybersecurity

OpenAI restricts access to stronger cyber agent

GPT-6 Cyber reaches approved defenders as OpenAI raises its own assessment of the model's cybersecurity risk.

src: openai.com · 2026-11-06

OpenAI has introduced GPT-6 Cyber to find and validate exploitable software flaws within researchers' boundaries. Initially available through the API and Codex to selected, approved Daybreak Red customers, it is not yet available to that entire customer group. The company says it will expand access.

OpenAI classifies the model as Critical in cybersecurity under its Preparedness Framework, up from High for GPT-5.6 Cyber. On its ExploitGym test, GPT-6 Cyber scored 48.5%, against 32.1% for its predecessor. These are company results, not independent measurements across ordinary software systems. OpenAI also tests whether agents respect their assigned scope: deliberately vulnerable supporting services sit beside a target, and the agent must recognise that attacking them would exceed its authorisation.

OpenAI says Daybreak Red API access requires approved network addresses by default, and it monitors credentials for compromise. A new access group permits approved critical infrastructure defenders to test sensitive systems. The challenge is helping defenders discover weaknesses while preventing tools with the same capabilities from enabling unauthorised attacks. Access controls and tests of agent behaviour address different parts of that problem.

MEMORY MANUFACTURING

Samsung reportedly plans new HBM base-die fab

A proposed Giheung facility would expand the logic capacity supporting high bandwidth memory for AI systems.

src: semimedia.cc · 2026-11-05

Samsung Electronics is reportedly planning a foundry fab at its Giheung campus in Yongin, South Korea, to make logic base dies for high bandwidth memory. SemiMedia, citing industry reports, puts the proposed investment at about KRW25 trillion. The project, called Kairos, would use 2nm and 4nm manufacturing processes.

The distinction between memory and supporting logic matters here. Samsung already produces HBM4 DRAM core dies at Hwaseong and Pyeongtaek, where some foundry lines also make 4nm logic base dies. Giheung would add capacity for those base dies and give the company more flexibility to expand HBM production for AI data centres.

The broader project could reach KRW30 trillion if an existing production line is converted into an advanced packaging facility. This remains a reported expansion plan. A construction contract runs from September 14, 2026, through December 31, 2028, but covers only part of construction. Equipment installation and commercial production dates have not been announced.

07 CHIP BRIEFING

ASE plans southern Taiwan packaging expansion

ASE plans NT$123.7 billion of advanced packaging and testing investment in southern Taiwan, SemiMedia reports. Approved on November 5, the project would add smart production lines across existing sites and is expected to create 3,553 jobs. It is a capacity expansion plan, with no commercial start date supplied.

src: semimedia.cc

Onsemi cancels Czech silicon carbide expansion

Onsemi and the Czech industry ministry announced the cancellation of a planned silicon carbide expansion costing up to $2 billion at Rožnov pod Radhoštěm. They cited market conditions and project economics. Existing silicon and silicon carbide manufacturing will continue unaffected, so the decision removes proposed capacity rather than closing current production.

VIS forecasts prices outpacing wafer shipments

Vanguard International Semiconductor expects fourth-quarter blended wafer prices to rise 3% to 5%, against shipment growth of just 0% to 2%. It says equipment bottlenecks limit output despite strong power-management demand. Those products generated 82% of third-quarter revenue. The outlook describes constrained growth, rather than a new factory coming online.

OPTICAL CONNECTIONS

More colours could widen AI's data highways

An emerging optical specification aims to connect accelerators with more bandwidth per fibre and less power spent moving data.

src: semiengineering.com · 2026-11-09

Faster AI computers need faster connections between them. Semiconductor Engineering describes an industry push to replace more copper links with optics. Light already dominates connections that expand systems across separate machines. Next come links between accelerators working as one larger group, first across racks and eventually within them. That transition concerns both bandwidth and the power spent moving data.

Today, removable optical transceivers commonly use one wavelength and multiple fibres. Raising capacity can require faster electrical interfaces, consuming more power, or more fibres and connectors. Connector costs make adding physical connections increasingly expensive, the article argues. An alternative carries several wavelengths, or colours, through one fibre, with traffic flowing both ways. The Optical Compute Interconnect Multi-Source Agreement, or OCI-MSA, defines a shared specification. Founders include AMD, Broadcom, Meta, Microsoft, Nvidia and OpenAI. Interoperability would let different suppliers' equipment communicate through the same optical system.

The first generation carries four wavelengths in each direction, each delivering an effective 50 gigabits per second after error correction and other signalling: 200 gigabits per second one way. Later generations aim to increase bandwidth. Adding colours provides another route to growth alongside faster individual channels. Placement matters too. Near-packaged optics puts optical hardware close to the computing chips; co-packaged optics brings it into the package. Broadcom's conference comparison claims co-packaged OCI can match pluggable reach at one-third of the power. That remains a supplier comparison, not a universal measured saving.

The article expects initial working implementations and possible interoperability demonstrations in 2027. It acknowledges that competing standards or proprietary designs could emerge. A published specification gives suppliers a common target, but does not establish that interoperable equipment is commercially operating. The next test is whether suppliers can demonstrate their implementations working together.

Parking reservations join the app

Uber is launching parking reservations in 15 US cities after acquiring SpotHero. The company says that deal opened access to 13,000 garages, lots and valet services across more than 400 cities. Drivers can book and pay in the app, with upfront pricing. Uber also envisages using parking locations as staging areas for autonomous vehicles, although the initial service targets human commuters.

Musk sets Cybertruck production end

Elon Musk says Tesla will end Cybertruck production in about eight months and return deposits it cannot fulfil. He argues factory resources would generate more value producing Cybercab robotaxis, disputing that the truck was unprofitable. Industry experts cited by TechCrunch estimate roughly 71,000 Cybertrucks sold since deliveries began in late 2023; Tesla does not report the model's sales separately.

Instagram's age estimation expands worldwide

Meta is expanding Instagram's AI age estimation worldwide to identify teenagers who provide adult birthdays. It says signals include profile text, school references and visual cues in photos and videos. Suspected teens enter Teen Accounts, with stricter messaging and privacy defaults. The expansion follows settlements worth up to $18 billion over allegations of harm to teenagers, including commitments to improve age identification.

Regulators question school-bus recall remedy

US safety regulators have opened a recall query after Waymo robotaxis continued illegally passing stopped school buses. NHTSA says most reported incidents happened after the software update intended to fix the problem. The inquiry will assess that remedy's adequacy. Waymo says it has improved vehicle behaviour and received no citations since March 2026, and will respond to the regulator.

Cloud breach may expose millions of customers

Iris Ohyama says unauthorised access to an external cloud service may have exposed information on about 7.7 million Iris Plaza customers. The total potentially includes 5.8 million current and former members and 1.9 million non-members. The company is still determining the impact. It says payment card information was absent from the affected service; related shopping systems were suspended on October 28.

IPO plans reportedly survive tech selloff

Anthropic wants to go public before Thanksgiving and raise $80–100 billion, according to Financial Times investor sources summarised by The Decoder. The reported target valuation is $1.25–1.75 trillion, below the $2 trillion hoped for by the most optimistic investors. Annualised reported revenue is about $81 billion. These are reported fundraising ambitions and revenue figures, rather than a completed offering.

Brazil data centre expansion under consideration

ByteDance is considering a second phase of its data centre project at Brazil's Port of Pecém, TechNode reports, citing Bloomberg sources familiar with the matter. The proposed addition would be larger than the existing 300-megawatt project under construction in Ceará state. ByteDance is reportedly seeking developers for that expansion. It has also held preliminary talks about a separate facility outside the port to serve Brazilian customers. The distinction matters because the port project can qualify for tax incentives by serving customers abroad. These are reported deliberations, with no completed expansion or operating date established.

Rust rewrite promises a lighter desktop app

Discord is moving its desktop app away from Electron and fully into Rust, The Verge reports. Chief technology officer Stanislav Vishnevskiy says the company has used Rust since 2018 across infrastructure, voice technology and parts of its client. He shared an image showing a Windows client using 290MB of memory, compared with the current app's potential to exceed 1GB across several servers. That is a company demonstration, rather than evidence of every user's eventual memory savings. Mobile will retain native interfaces while sharing Rust application code with desktop. User testing is planned soon; a full transition date remains unclear.

12 WORLD REPORT Thu 5 → Mon 9 Nov

Border clashes displace more than 50,000

More than 50,000 people have been displaced by clashes around Ethiopia's Moyale area, a Kenya Red Cross regional official said. The estimate includes people staying with relatives and host families as well as those in temporary settlements. Al Jazeera says the overall total has not been independently established. Ethiopia's Red Cross is also providing emergency shelter and household supplies.

Iran talks stall amid further strikes

Donald Trump said renewed fighting with Iran was highly unlikely as US forces struck Qeshm Island in the Strait of Hormuz. Secretary of State Marco Rubio reported no progress in negotiations. Iran says sanctions and the blockade must end before talks. Reports of tanker mine strikes add to the risks facing shipping through the contested waterway.

MIDDLE EAST · euronews.com

Ukrainian drones hit major Russian refinery

Ukrainian drones struck Russia's KINEF refinery, causing major fires and damaging three processing units, Euronews reports. The plant handles roughly 7% of Russian refining capacity and has been targeted repeatedly during the war. Separately, Rosneft capped fuel sales in six regions, with urban drivers limited to 30 litres per transaction. The report describes mounting pressure on fuel supplies.

EASTERN EUROPE · euronews.com

Migrant boat sinking kills at least 39

At least 39 people died when a migrant boat sank off Senegal, the Senegalese Press Agency reports. The interior ministry said one person was rescued and the number missing remained unknown. Searches along 25 kilometres of coastline were hampered by difficult access and strong currents. The government says it will strengthen cooperation with neighbouring countries against people-smuggling networks.

WEST AFRICA · bbc.co.uk

Election leaves government formation unresolved

New Zealand faces weeks of uncertainty after Saturday's election produced no decisive winner, NPR reports. Parties will wait for final results on November 27 before negotiating a government. Nearly 400,000 special votes, including overseas ballots, remain to be counted. Prime Minister Christopher Luxon has not claimed victory and will lead a caretaker administration while the outcome is settled.

NEW ZEALAND · npr.org

Minimum wage increase brought forward

France will implement a 1.6% minimum wage increase on December 1, a month earlier than planned, Prime Minister Sébastien Lecornu announced. The government is responding to weeks of protests that broadened from school funding to living costs. The change falls short of union demands: the CFDT wants another 100 euros monthly, while the CGT seeks a 10% rise.
