01 COVER STORY NVIDIA leadership

Jensen Huang leaves NVIDIA; finance chief takes over

Colette Kress becomes interim chief executive as the board searches for a permanent successor and promises continuity.

src: engadget.com · 3 min read

NVIDIA's board said on Thursday that Jensen Huang had resigned as president and chief executive, effective immediately, and relinquished his board seat. Huang had led the company since its founding. Chief financial officer Colette Kress takes over as interim CEO while retaining her existing responsibilities.

The board is beginning a search that will consider internal and external candidates. It also appointed Harvey Jones as NVIDIA's first board chair. Jones previously served as chief executive and executive chairman of electronic design automation company Synopsys.

Jones said Kress understood NVIDIA's business, customers, operations and finances, and expressed confidence in the existing leadership team. The board expects operations, customer commitments and the technology roadmap to continue without interruption. That is its assurance during the handover, rather than evidence of how the transition will unfold.

The resignation follows the board's announcement of an investigation after Huang admitted an affair with a former technology executive accused of being a Chinese intelligence asset. The board had said it had no reason to believe national security or NVIDIA secrets were compromised.

02 TECH RADAR

Microsoft services disrupted worldwide

Microsoft said unexpectedly unavailable servers disrupted services including Outlook, Teams and Copilot worldwide. It reported limited recovery after returning some affected servers to service.

03 AI Software verification

DeepMind reports proofs for Signal's cryptographic core

AlphaProof Code used AI agents to write mathematical proofs, with experts setting requirements and reviewing flagged code.

src: the-decoder.com · 2026-11-11

Google DeepMind says its AlphaProof Code system verified the actual cryptographic core of Signal's software in four weeks, completing work that would typically take years. The Decoder reports the demonstration as a step beyond earlier verification efforts focused on the protocol's theoretical design.

Experts first defined formal security requirements. AI agents built on Gemini Carbon then wrote more than six million lines in Lean, a language used to express mathematical proofs. The system flagged roughly one percent of the codebase for human review, according to the researchers' account.

The distinction matters: checking a design and checking the code running on users' devices address different stages of software security. Here, the claimed result concerns whether that cryptographic core meets the requirements experts specified. It should be read at that scope, rather than as a verdict on every part of Signal.

The researchers also report that the system immediately caught two deliberately planted bugs. Signal chief technology officer Ehren Kret says the approach strengthens trust in data privacy as AI threats grow. DeepMind plans to extend the method to power grids and medical devices through systems such as CodeMender.

JAPANESE CHIPMAKING

Rapidus holds its target as delay reports mount

Reports question process readiness, while the Japanese foundry keeps its original timetable for 2nm mass production.

src: semimedia.cc · 2026-11-11

Rapidus still targets 2nm mass production in the second half of fiscal 2027: October 2027 to March 2028. It reaffirmed that plan on November 10 after Jiji Press reported that process and yield problems could delay output by about a year. No revised schedule has been announced.

The firm announced working gate-all-around transistor prototypes in Chitose in July 2025. Jiji says linking them with other parts has proved difficult. Bloomberg reported that working SRAM memory cells had not been demonstrated, missing a milestone its sources said was needed by summer 2026 for its planned production start.

Bloomberg also cited dust and particle problems in the cleanroom. A working transistor is an early step, well short of reliable commercial output. Rapidus declined to give technical details, citing confidentiality. Japan has earmarked more than 2 trillion yen in state funding, Bloomberg says, giving the timetable public stakes as well as commercial ones.

07 CHIP BRIEFING

Terafab's huge capacity remains a reported target

Terafab reportedly told equipment suppliers it aims for roughly one million wafers a month from 2032, according to Nikkei as reported by SemiMedia. Around 700,000 would be memory wafers. The Tesla- and SpaceX-backed project has not disclosed its memory product mix or detailed manufacturing arrangements; these are capacity ambitions.

Texas Tech receives semiconductor research funding

Texas Tech's engineering college received an additional state semiconductor innovation award exceeding $19 million, Semiconductor Digest reports. University researchers say it will support interdisciplinary research, student training and possible industry collaboration. This is funding for research infrastructure and workforce preparation, with benefits described by the university; it does not establish new commercial production.

src: semiconductor-digest.com

Edge AI pushes processing closer to memory

Semiconductor Engineering examines processing near or inside memory to reduce data movement, power use and delay. Battery-powered vehicles and drones could devote more energy to other functions if processing consumes less. The approaches still face software, thermal and architectural challenges; compilers, operating systems and standards need further development.

DATA-CENTRE POWER

Electricity shapes the fight over data centres

Grid connections and private power plants create different local pressures, but both turn AI expansion into an infrastructure question.

src: technologyreview.com · MIT Technology Review · 2026-11-09

Opposition to AI data centres is often discussed as a reaction to technology companies. Reporting from Virginia's Data Center Alley in MIT Technology Review offers a more concrete explanation: electricity. The question is how an enormous new industrial load gets power, who pays for the supporting infrastructure and what happens around it.

One route is to connect to the existing grid. In Loudoun County, where construction has proceeded more steadily than in newer development areas, that is common. An Equinix facility visited by the writer draws electricity from Dominion Energy and keeps large diesel generators for backup. Much of Dominion's generation uses natural gas.

Adding demand makes the allocation of costs a public issue. Protests in Virginia have helped bring rules requiring data centres to pay the full cost of new transmission lines, rather than spreading it among other customers. Developers are also preparing for possible rules cutting their grid access during periods of peak demand.

The other route is to generate power on site. The report describes AI developments in rural areas with little grid infrastructure, where companies plan natural-gas turbines and backup diesel generators. This arrangement is called behind-the-meter power: the site brings its own generation rather than depending entirely on the utility's network.

That can reduce pressure on a grid connection, but it still puts substantial electricity infrastructure near communities. Residents have traditionally expected a say when utilities build projects on this scale. Private generation raises the same practical question of where that infrastructure goes and how the surrounding area is affected.

Electricity does not explain every objection. The report also identifies worries about jobs, concentrated corporate power and AI risks. But separating the two power routes makes the debate easier to assess: examine the grid costs, the proposed generation and the local decision process.

IPO roadshow opens with proposed share price range

Anthropic launched the roadshow for a proposed offering of 825 million shares, with an expected price of $70 to $78 each. Most would be newly offered by Anthropic; existing holders would sell the remainder, with no proceeds from their sales going to the company. It has applied for Nasdaq listing under ANT. The offering is proposed, rather than completed.

Airline moves to block customer AI agents

United Airlines will block AI agents from managing reservations and buying flights, citing cybersecurity, privacy and potential legal risks. The Record reports that the airline is updating booking, ticketing and distribution policies. Its action reflects a wider problem for companies trying to distinguish customers from automated assistants while warning that handing agents login credentials can expose sensitive account information.

Gemini eyewear pre-orders open ahead of December launch

Google opened pre-orders for Gemini-equipped glasses developed with Gentle Monster, Warby Parker and Samsung, ahead of a December 10 launch. It says the frames offer directions, translation and conversational visual descriptions, plus access to human interpreters through Aira. Google also says Gemini camera visuals are excluded from model training and advertising, and bystanders' faces are automatically redacted before processing.

Paid Muse subscribers can delegate business calls

Meta's Muse can now call U.S. businesses for paying subscribers, expanding a feature previously tested with selected users. TechCrunch reports plans start at $20 a month. Meta presents it as a way to delegate tasks such as restaurant reservations or calls to a cable company. Reception remains a constraint: the report says some businesses hang up on AI callers.

Sign-language interpretation comes to selected Apple TV films

Apple announced optional sign-language interpretation in its TV app from November 13, launching with Being Heumann and F1. American and British Sign Language versions will be available, with more films planned later this year. Apple says Deaf and native signers designed and tested the experience. Supported titles receive an icon, while viewers enable the feature through the app's settings.

Fitness tracker adds a health-data social network

Whoop launched Humans, a social network where members can share wearable metrics, activities and photo posts. Users choose what to disclose; sensitive activities are excluded by default, and a Stealth Mode temporarily hides health and performance data. Chief executive Will Ahmed describes accounts as representing people with verified heartbeats. The existing Teams feature, including group leaderboards, remains available, Whoop says.

Data-centre power demand drives a larger revenue forecast

Infineon forecasts fiscal 2027 revenue growth above 20%, to approximately €20 billion, supported by data-centre power supplies, energy infrastructure and software-defined vehicles, SemiMedia reports. It expects data-centre power revenue near €4 billion, compared with €2.2 billion in fiscal 2026. The forecast assumes an average exchange rate of $1.15 per euro. Full-year fiscal 2026 revenue rose 12% to €16.353 billion. Planned investment of €3 billion to €3.5 billion in the coming year accompanies the outlook. These figures distinguish completed annual sales from management's expectations for the next year, which depend on demand and currency assumptions.

Cloud service changes backups after unrecoverable data losses

Yandex Cloud says 2.84% of customer data could not be restored after equipment was critically damaged in Ukrainian drone strikes, Tom's Hardware reports. The company says users who used its cloud backup tools lost no data, and partly attributes unrecoverable losses to missing customer backups. Newly created virtual machines now have backups enabled by default. Yandex is also opening another availability zone to improve resilience, initially with a limited service range. It has withheld the site's geographic location. The changes follow damage to several data-centre locations, turning recovery arrangements into an immediate concern for customers.

U.S. envoys brief Putin after direct talks

U.S. envoys Steve Witkoff and Jared Kushner met Vladimir Putin after mediating direct Russian-Ukrainian talks in Abu Dhabi. NPR reports no major breakthrough beyond agreement on a prisoner swap, whose size was not announced. The envoys planned to meet Volodymyr Zelenskyy in Dublin next, while seeking Russian acceptance of European participation in negotiations.

Finland confirms attack on Russian warship

Finnish officials confirmed an attack on a Russian warship in the Gulf of Finland, with few details available. Ukraine's SBU said it targeted the Naro-Fominsk during a broader operation against the Ust-Luga oil export depot. BBC reporting places the incident in waters open to civilian shipping, raising questions about the reach of Ukraine's strikes.

Vice president resigns amid eligibility questions

Indonesia's Vice President Gibran Rakabuming Raka submitted his resignation in Jakarta on Thursday, NPR reports. The departure followed growing questions over his eligibility for office after recent court rulings disputed his educational credentials. NPR says the academic investigation was apparently unrelated to separate inquiries into allegations that senior police officials were involved in wiretapping targeting the president.

INDONESIA · npr.org

Marshes recover slowly after years of drought

Rain has revived parts of Iraq's southern marshlands after five years of drought, and some displaced herding families are returning, NPR reports. A buffalo herder says milk yields have doubled from drought levels. Recovery remains vulnerable to sewage pollution and water policies in Iraq, Turkey and Syria, which share the rivers feeding the region.

Colom win expands Democrats' incoming Senate majority

Democrat Scott Colom defeated Republican Senator Cindy Hyde-Smith in Mississippi by a few thousand votes, NPR reports. He will become the state's first Black senator in nearly 150 years. The result increases the Democrats' majority in the new Congress to 55 seats, while Alaska remains undecided, strengthening the party's position in the incoming Senate.
