15 trending repos **2** deep dives · p.2

			STARS	GAINED
01	Renhuai123/**ziwei-doushu**	TypeScript	16k	+7k
	An open charting engine gives Chinese astrology enthusiasts traditional calculation methods, classical texts and interpretation datasets.			
02	D4Vinci/**Scrapling**	Python	97.3k	+6.1k
	A Python scraping framework helps data collectors fetch pages, render JavaScript and build crawlers with reusable sessions.			
03	calesthio/**OpenMontage**	Python	76.9k	+3.7k
	A video production system gives creators automated pipelines and tools operated through an AI coding assistant.			
04	harry0703/**MoneyPrinterTurbo**	Python	140k	+3.5k
	An automated video generator helps creators turn topics into scripts, matched footage, subtitles and finished short videos.			
05	shiyu-coder/**Kronos**	Python	46.9k	+3k
	A financial market model helps researchers study candlestick data using training drawn from many global exchanges.			
06	Nasiko-Labs/**nasiko**	Rust	11.8k	+2.2k
	An agent runtime helps teams discover coding agents, monitor their costs and route requests to chosen models.			
07	JuliusBrussee/**caveman**	Go	118k	+1.9k
	A skill and proxy help coding agent users shorten responses and reduce the text their agents consume.			
08	herdrdev/**herdr**	Rust	48.2k	+1.8k
	A terminal runtime helps developers monitor coding agents across machines and keep work running after client disconnections.			
09	garrytan/**gstack**	TypeScript	140k	+1.6k
	A collection of coding agent tools gives founders structured roles for product planning, engineering reviews and quality assurance.			
10	hyprwm/**Hyprland**	C++	40.3k	+1.3k
	A customizable Wayland compositor helps desktop users arrange windows dynamically, with visual effects and support for plugins.			
11	max-sixty/**worktrunk**	Rust	11.3k	+1.3k
	A Git worktree manager helps developers organize parallel agent tasks, automate local workflows and manage separate changes.			
12	Crosstalk-Solutions/**project-nomad**	TypeScript	42.3k	+1.1k
	An offline knowledge server helps users keep books, Wikipedia, courses, maps and optional AI on their own hardware.			
13	THU-MAIC/**OpenMAIC**	TypeScript	42.7k	+1k
	An interactive classroom system helps learners use AI teaching experiences and guided projects with configurable model providers.			
14	guillaumemeyer/**watermarks-remover**	Python	26.3k	+1k
	A Python service and agent skill help owners remove provenance metadata and other marks from their content.			
15	The-PR-Agent/**pr-agent**	Python	15k	+966
	A community maintained AI review agent helps software teams review pull requests using an open source project.			

A library that survives the lost connection

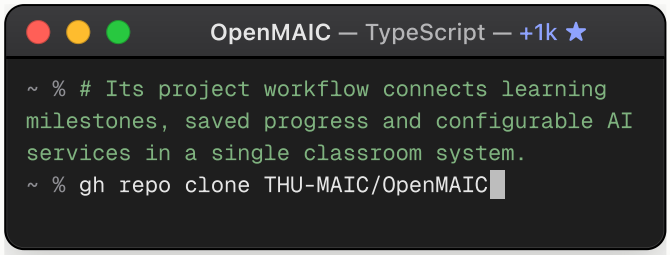

Project NOMAD assembles offline reference material, courses and optional local AI behind a browser interface on hardware you own.

Project NOMAD turns a computer into a local knowledge server. Its browser interface combines offline Wikipedia, medical references, books, courses, maps and optional AI chat. The idea is to manage these resources together, saving users from setting up every app separately. Its Command Center manages tools in Docker containers and offers a catalog for adding more apps to the collection.

Kiwix supplies reference libraries, Kolibri provides courses with progress tracking, and ProtoMaps handles regional maps. Optional AI uses Ollama and Qdrant to search uploaded documents. Notes and data tools are included too, alongside optional updates on a user-controlled schedule. Going offline requires preparation: installation and later content downloads need internet access. The core app needs about 5 GB of storage; added content fills the drive, while AI raises memory needs.

The README recommends stronger hardware for AI, including 32 GB of RAM and a suitable graphics card. Access needs care too: NOMAD has no authentication. Its maintainers recommend network controls for local sharing and advise against direct internet exposure. The appeal is a library on hardware you own, with owners choosing the content and managing access. These features and limits come from its documentation; this account does not reflect hands-on testing.

An AI classroom built around doing

OpenMAIC combines interactive lessons with guided projects, while letting operators choose the models behind different teaching functions.

OpenMAIC uses multiple AI agents to create interactive lessons. Its latest documented release adds guided projects: learners work through requirements, design and implementation while an AI tutor answers questions. The aim is to get a project running and understand how it works. The project says milestones provide feedback and a personal learning report, with work and progress saved for later sessions.

That workflow needs an execution sandbox and checkpoint storage; it stays disabled without them. Operators must therefore set it up before learners can use it. OpenMAIC runs generation on a server, so work can continue across closed tabs and restarts. Its current architecture requires PostgreSQL and a server that stays running. Operators assign models to tasks such as course outlines, slide content and speech, and can lock choices or block users from adding service keys.

Classes can be exported as slide presentations or an offline HTML lesson, giving the content a life beyond the running app. The README also lists upgrade limits: some database changes need a restore to roll back. The interest is in bringing lessons, practical tasks and saved work together. These are documented project features, without hands-on verification here or evidence that they improve learning outcomes.
