15 trending repos **2** deep dives · p.2

			STARS	GAINED
01	Nutlope/**hallmark** A design skill that helps coding agents build websites with distinctive themes and checks for common visual weaknesses.	CSS	45.3k	+11.6k
02	pingdotgg/**t3code** A desktop, web and mobile interface for developers to control coding agents already running on their own computers.	TypeScript	39.2k	+6.9k
03	affaan-m/**ECC** A collection of skills, memory and security tools intended to improve how developers work with AI coding agents.	JavaScript	295k	+6.3k
04	obra/**superpowers** A framework of reusable skills that gives coding agents a structured methodology for completing software development work.	Shell	311k	+5.9k
05	thedotmack/**claude-mem** Captures agent activity, compresses it into memories and supplies relevant context when developers begin future coding sessions.	TypeScript	110k	+5.9k
06	milind-soni/**OpenMausBot** A chat application giving users teams of AI bots with virtual machines and their own choice of agents.	TypeScript	10.9k	+4.8k
07	blader/**humanizer** An editing skill for writing assistants that identifies common AI prose habits and rewrites text to sound more natural.	Python	63.7k	+2.8k
08	anthropics/**skills** Anthropic's collection of instructions, scripts and resources teaches Claude repeatable approaches to documents, data analysis and other tasks.	Python	187k	+2.6k
09	ruvnet/**RuView** A WiFi sensing platform that aims to infer presence, movement and vital signals without cameras or wearable devices.	Rust	102k	+2.5k
10	beenuar/**AiSOC** A self-hosted security operations platform that correlates alerts, investigates threats with AI agents and proposes human-approved responses.	Python	6.5k	+2.5k
11	CopilotKit/**OpenBot** Gives AI coworkers separate browsers, files and tools, letting organizations run assistants on infrastructure they can control.	TypeScript	9.8k	+2.3k
12	AstrBotDevs/**AstrBot** A chatbot platform connecting AI models, plugins and agents to messaging applications for individuals, developers and teams.	Python	45.6k	+2.2k
13	github/**spec-kit** A toolkit giving coding agents structured processes and reusable templates for building features, fixing bugs and assessing ideas.	Python	145k	+2.1k
14	openai/**codex** OpenAI's coding agent runs locally in a terminal, helping developers work on software directly from their own computers.	Rust	133k	+2k
15	cjpais/**Handy** An offline desktop dictation application that turns speech into text and pastes it into the application being used.	Rust	36.9k	+1.7k

WiFi sensing needs careful proof

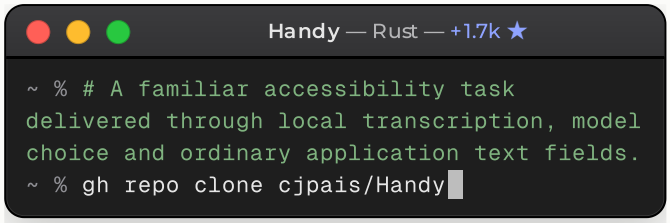

RuView turns radio disturbances into room information, while its documentation separates research benchmarks from unfinished sensing features.

RuView explores a way to observe rooms through changes in WiFi signals. Its README describes using ESP32 sensors to capture Channel State Information: radio disturbances caused by people moving or breathing. The project aims to infer presence, activity and vital signs without cameras or wearables. Those are project claims, rather than results independently verified here. Its appeal is a sensing method that could serve rooms where cameras are unwelcome.

The system is designed to run locally on edge hardware. Tools record signals, train models and load profiles. Home Assistant support and bridges to other smart-home systems can turn readings into household states, such as room occupancy. The documentation also describes adding uncertainty and source records to sensing events, helping users trace where a reported state came from.

The limits deserve close reading. A perfect presence-detection claim came from a single-class recording and has been retracted. A published pose benchmark is separate from the unfinished live pose feature. The wider unified radio world model still needs real-data validation; device-reported vital signs are labelled unvalidated. These distinctions help separate research from reliable monitoring. The README supports exploring signal collection and local automation, but health and body-tracking claims need evidence for the actual hardware and room in use.

Dictation that stays on your computer

Handy makes local speech models available through a shortcut and a text box, with practical attention to desktop integration.

Handy is an open-source dictation app for Windows, macOS and Linux. Press a shortcut, speak, then release it to turn speech into text and paste it into the active app. The project says speech processing stays on the computer without sending audio to the cloud. That makes local processing part of its appeal for people who want to dictate into ordinary text fields.

Silero voice activity detection filters silence before transcription. Users can choose Whisper models in several sizes, with GPU support when available, or the CPU-focused Parakeet V3 with automatic language detection. Shortcuts can work by holding keys or toggling recording. The app also needs microphone and accessibility permissions. These are practical parts of making dictation work across desktop software, beyond the speech model itself.

The README explains problems that a simple demo might miss. On some Linux setups, the recording overlay can disrupt pasting. Clipboard timing can also cause old text to appear instead of the new transcript. The guide describes delay settings and an experimental Reliable Paste option for macOS and Windows. Those details make the workflow easier to assess, but they do not establish speed or accuracy on a reader's computer. Hardware, speech and the receiving app remain questions for actual use.
