			STARS	GAINED
01	cloudflare/**security-audit-skill**	JavaScript	49.1k	+16.6k
	A structured security audit skill for coding agents, organizing investigations, independent verification and machine-readable findings for reviewers.			
02	stablyai/**orca**	TypeScript	108k	+9.2k
	A workspace for running coding agents side by side, with separate worktrees and monitoring from desktop or mobile.			
03	xerj-org/**xerj**	Rust	17k	+8.3k
	A local search engine indexes code, documents and logs so AI agents can retrieve relevant passages with citations.			
04	Graphify-Labs/**graphify**	Python	137k	+7.2k
	Builds a queryable knowledge graph from code and supporting documents, helping coding assistants trace relationships across projects.			
05	pbakaus/**impeccable**	Rust	89.8k	+5.9k
	Design guidance and checking tools help coding agents critique, refine and improve the interfaces they generate.			
06	heygen-com/**hyperframes**	TypeScript	73.5k	+5.5k
	Turns HTML, CSS and seekable animations into videos, giving creators and coding agents a programmable production workflow.			
07	anomalyco/**opencode**	TypeScript	222k	+5.1k
	An open source AI coding agent available through command-line installation and a beta desktop application for developers.			
08	tashfeenahmed/**freellmapi**	TypeScript	42.4k	+4.7k
	Combines free AI provider tiers behind one compatible endpoint, routing requests and switching providers when limits intervene.			
09	Comfy-Org/**ComfyUI**	Python	143k	+4.1k
	A node-based interface and backend for diffusion models, helping creators assemble modular AI content generation workflows.			
10	TauricResearch/**TradingAgents**	Python	117k	+3.4k
	A framework for financial trading research using multiple language-model agents, with reports and tools for evaluating decisions.			
11	NVIDIA/**OpenShell**	Rust	20.2k	+3.4k
	A runtime for autonomous agents that enforces policies on files, network connections and credentials inside isolated sandboxes.			
12	makecindy/**cindy**	TypeScript	7k	+2.9k
	A local AI agent client combines models and tools to work with users' files and logged-in applications.			
13	akitaonrails/**ai-memory**	Rust	13.9k	+2.8k
	Shared long-term memory helps coding agents hand tasks between different tools without repeatedly explaining prior work and decisions.			
14	anthropics/**knowledge-work-plugins**	Python	33.3k	+2.8k
	Plugins customize Claude for professional roles by combining skills, connectors and commands around company workflows and tools.			
15	pollen-robotics/**microduck**	Rust	12.7k	+2.7k
	Software for a tiny biped robot, running learned movement policies alongside motor control, communications and reversible updates.			

hyperframes — TypeScript — +5.5k ★

```
~ % # Its rendering model connects
editable web source with frame-by-frame
video production.
~ % gh repo clone heygen-com/hyperframes
```

Web pages become a video production format

HyperFrames turns familiar web building blocks into repeatable videos, with explicit timing and a workflow for coding agents.

HyperFrames is an open-source framework that turns HTML, CSS, media and seekable animations into MP4 video. It is aimed at creators who want programmable compositions and at coding agents that can write the source. The distinctive idea is to treat a video as a web composition with an explicit timeline, giving automated authoring a format it can inspect and revise.

The README describes adding timing and track attributes to HTML, then using animation tools such as GSAP, CSS or Three.js. A preview runs in the browser. During rendering, headless Chrome seeks each frame and FFmpeg encodes the result. The project says this makes the same input produce the same video. Local use requires Node.js 22 or later and FFmpeg; Docker rendering is also documented.

Agent skills teach a production loop: plan, write valid HTML, connect animations, add media, lint, preview and render. A catalog supplies editable components for titles, captions, charts, maps and transitions. Those pieces make the framework relevant to product explainers and recurring visual reports, where a reusable composition can matter as much as a single finished clip.

The documentation marks the browser-based Studio as available but evolving. This account describes the supplied README, without independent rendering tests. The central promise is reproducible composition from editable source; judging visual quality still requires inspecting the actual frames.

microduck — Rust — +2.7k ★

```
~ % # Its documented architecture shows how
learned behavior fits into a recoverable
physical system.
~ % gh repo clone pollen-
robotics/microduck
```

A small robot separates movement from maintenance

Microduck combines learned movement with distinct services for motors, communications and software recovery on a tiny biped.

Microduck is the software brain of a tiny biped robot, described in its README as about 25 centimetres tall and weighing 800 grams. A Rockchip RK3566 runs a 50 Hz control loop that drives fifteen servos using neural movement policies. Training lives in a separate project that exports the ONNX policies loaded here.

The interesting part is how much surrounds the learned movement. One Rust workspace contains separate services: robotd owns the control loop and motor bus, configd manages Wi-Fi and identity, and other daemons handle Bluetooth, gamepad input, camera streaming and the depth sensor. They communicate through a shared JSON-RPC contract over Unix sockets. The app, console, gamepad and scripts therefore share one interface.

Updates are treated as part of operating a physical machine. The updater installs signed releases and rolls back if the robot starts in an unhealthy state. The README also points to a simulator that runs the real daemons against a body in MuJoCo, so the software can be explored without a robot.

The project describes walking, standing after a fall and switching to a roller policy when wheels are fitted. These are documented capabilities, without hands-on verification here. Its appeal is the complete system around those behaviors: control, communication and recovery are visible alongside the neural policies.
