15 trending repos **2** deep dives · p.2

			STARS	GAINED
01	debpalash/**VoiceStudio** A local voice studio for creators, combining voice cloning, video dubbing, transcription, dictation and audiobook production.	Python	93.2k	+12.9k
02	HKUDS/**DeepTutor** A personalized tutoring project for learners seeking ongoing support, presented by its creators as a lifelong learning companion.	Python	48.4k	+5.7k
03	Leonxlnx/**taste-skill** Gives coding agents visual guidance through art direction, reference images and browser checks when building web pages.	JavaScript	105k	+3.9k
04	JetBrains/**thinkrail** A lightweight development environment for people coding with pi, designed to adapt its interface around their work.	TypeScript	5.3k	+3.7k
05	AgriciDaniel/**claude-seo** Adds search optimization capabilities to Claude Code, covering technical audits, structured data, backlinks and local search work.	Python	23.5k	+3.5k
06	remotion-dev/**remotion** Lets creators and developers make videos programmatically with React, turning familiar interface code into video production.	TypeScript	68.7k	+2.6k
07	gitroomhq/**postiz-app** Helps social media teams schedule, automate and analyse content through a shared platform for managing their publishing.	TypeScript	40k	+2.4k
08	nightly-labs/**openbot** A desktop workspace for persistent AI teammates, with task queues, file sharing, browser control and dedicated workspaces.	TypeScript	3.4k	+2.2k
09	NVIDIA/**SkillSpector** Scans AI agent skills for vulnerabilities, malicious patterns, prompt injection, data theft and other security risks.	Python	23.1k	+2.2k
10	thesysdev/**openui** A generative interface standard for teams building applications that need to present AI output through user interfaces.	TypeScript	14.4k	+1.5k
11	strelov1/**freehire** An open job search engine for applicants, collecting vacancies and providing search, application preparation and tracking tools.	Go	3.3k	+1.2k
12	anthropics/**sandbox-runtime** Restricts filesystem and network access for arbitrary processes at operating system level, helping developers sandbox software without containers.	TypeScript	6.8k	+1.2k
13	microsoft/**skill-recorder** Records desktop work sessions and reconstructs their intent and steps to help users create reusable skills or automations.	TypeScript	5.5k	+1.2k
14	ollama/**ollama** Helps people get language models running, including Qwen, Gemma, DeepSeek and other supported families of AI models.	Go	185k	+1.1k
15	vllm-project/**vllm** An inference and serving engine for teams running language models, designed for high throughput and efficient memory use.	Python	95.8k	+1.1k

```

A voice production desk on your device

VoiceStudio brings multiple speech tasks and model engines into a local application, with different support levels across platforms.

VoiceStudio aims to put speech production on the user's device. Its documented tasks include cloning a voice from a clean reference recording, designing a voice from a written description, dubbing video, dictating text and narrating audiobooks. The project claims support for 646 languages. Its appeal is the combination of tasks in one workspace, rather than a single speech generator requiring a separate application for each subsequent step.

The default engine uses OmniVoice, but a model manager lets users choose other engines and download only the models they need. The application asks before downloading a model. For repeated work, the README describes queued jobs, watch folders, reusable recipes and a local programming interface. These features connect individual voice experiments to longer production workflows, such as batch narration or repeated processing of incoming files.

Platform support needs careful reading. The project lists Apple Silicon macOS, Windows, Linux and Docker as stable; Android and iPhone versions are previews. Intel Macs provide the interface while connecting to a remote backend. The README says CPU operation is possible but slower, with acceleration varying by platform and engine. These are documentation claims, not our performance measurements. Buyers of the idea should therefore check their intended engine and device before assuming the same experience across all supported systems.

freehire — Go — +1.2k ★
~ % # Links vacancy ingestion, deduplication
and application tracking in a self-
hostable project.
~ % gh repo clone strelov1/freehire
```

Job search with an inspectable supply chain

Freehire combines vacancy collection with application tools, while its source breakdown complicates the promise of jobs straight from employers.

Freehire is a job search engine with tools that go beyond finding vacancies. Its README lists saved searches, email and Telegram digests, a CV builder, application tracking and an inbox that links recruiter replies to applications. It is MIT-licensed and can be self-hosted. A public interface lets other apps query the catalogue without a key, making the data useful to job seekers and people building search tools.

The pipeline fetches listings, puts them in a common format and merges reposts using a stable key. Search filters cover region, work mode, seniority, skills and salary. The README says these come from curated dictionaries rather than guesses. Separate workers handle crawling, enrichment, indexing and alerts, while the web server serves the interface for accessing their work.

The source breakdown needs care. The introduction promises jobs straight from company career pages, but the detailed list includes aggregators, job boards and Telegram channels. The claim of over 3.3 million postings is therefore no guarantee of an exclusively direct-employer collection. The project exposes both this mix and its data pipeline. Some features need optional language-model credentials; they stay disabled when those are absent. We have not tested listing freshness, matching quality or the application tools.
